

OSINT and Forensics, finally one workflow.

Open-source platform that turns public-source intelligence into court-admissible evidence — with a cryptographic chain of custody from finding to verdict.

MIT
licensed

6 AI
adapters

Hash-chained
audit

Self-host or
SaaS

Two tools, one investigation, zero accountability.

WORKFLOW SPLIT

OSINT analysts use Maltego / SpiderFoot / Hunchly.
Forensic examiners use EnCase / AXIOM / Cellebrite.
Nothing bridges them — copy-paste is the integration.

CHAIN OF CUSTODY IS ARTISANAL

Excel spreadsheets, emailed hash digests, screenshots stored in shared drives. No replay. No tamper-evidence.
Court challenges land here.

VENDOR LOCK + COST WALL

EnCase + AXIOM + Maltego = 5–6 figure annual spend.
Smaller investigators, journalists, NGOs are priced out.
AI features are gated behind enterprise tiers.

The deal: "We found it on the open web, here's the screenshot, trust us."
That's not an audit trail. That's a vibe.

One platform owns the journey from lead to verdict.

01. Run the OSINT pipeline.

7 agent groups in parallel through one swappable AI adapter.

02. Capture findings with provenance.

Each finding carries confidence, source URLs, agent group, reasoning trace.

03. Promote to forensic evidence.

One click bridges a finding into a Case with hash + commit on its own branch.

04. Lock the chain.

Every write appends a SHA-256 forward-chained audit row. Replay verifies.

05. Sign-off + export.

Merge-request review on evidence branches; markdown / PDF reports.

Dashboard.

SINGLE PANE

Both workflows on one screen.

Live counts pulled straight from the database. How many investigations are open, how many are bridged to a case, how many evidence items live across all cases, which AI adapter is active right now. Click any row to drill in.

Pipeline runner.

OSINT IN ONE CLICK

Six adapters. One button.

Pick an investigation, toggle agent groups, hit Run. The platform drives the AI adapter end-to-end and shows stage progress. When the run completes, the 'Open forensic case' button bridges the findings into a case with hash + commit.

Git-style evidence chain.

Operation Sandstone

CASE-2025-007

VERIFIABLE FORENSICS

Every evidence change carries a hash + a commit.

Lane-per-branch, branch-coloured dots per commit, verified ring around verified commits. Sealed evidence is immutable. This is the structure that survives a court challenge.

forenix-oss · OSINT × Forensics, one platform

Cryptographic integrity.

TAMPER-EVIDENT

One button replays the chain.

SHA-256 forward chain: hash = sha256(prev | action | entity | id | iso(t)). Click 'Verify chain' and the platform replays every audit row, breaks loudly on tampering, and shows the expected vs stored hash for forensic inspection.

Why now.

LLMs make per-investigation OSINT cheap.

Hosted models (NVIDIA NIM, OpenRouter, GLM) bring 70B-class quality to \$5/mo budgets. The agent-group pipeline is finally viable for single-investigator shops.

Disinformation + sanctions evasion at scale.

Russia/UA, Gaza, crypto-sanctioned-entity tracking, election interference — every analyst's caseload is up 3–5× since 2022.

Courts are starting to accept open-source evidence.

Bellingcat-style findings now appear in ICC + national-court filings. What's missing isn't the data — it's a defensible chain.

Open-source forensics is having a moment.

Velociraptor, Hayabusa, MISP, OpenCTI: the community has moved past 'cloud-only'. We're the OSINT+forensics piece that's still missing.

Market.

TAM

Global cybercrime investigations + e-discovery + threat-intel.

\$110B by 2027 (combined Gartner + IDC).

SAM

Mid-market + boutique investigative shops + government contractors.

\$9B annual seat licenses (Maltego, EnCase, AXIOM, Cellebrite, Relativity).

SOM

Self-hosted + free OSS users converting at 4% to a \$99-\$499/mo SaaS tier.

\$30M ARR within 3 years on a 100K-user OSS funnel.

Where we sit.

OPEN SOURCE → CLOSED SOURCE		
UNIFIED OSINT + FORENSICS → SINGLE WORKFLOW	OPEN + UNIFIED · forenix-oss (us)	CLOSED + UNIFIED · Palantir Gotham (heavy) · IBM i2 (legacy)
	OPEN + SINGLE · SpiderFoot (OSINT only) · Velociraptor (forensics only) · MISP (intel only)	CLOSED + SINGLE · Maltego (OSINT) · EnCase / AXIOM / Cellebrite (forensics) · Relativity (eDiscovery)

We are the only product where the OSINT lead and the forensic chain live in one MIT-licensed schema.

How we make money.

CORE

MIT-licensed open source

Every analyst feature. 5 of 6 adapters (mock, Ollama, GLM, OpenRouter, NVIDIA). Self-host forever.

\$0

TEAM

Hosted single-tenant

Managed Postgres + backups + dashboards + Sentry + cron monitors. Email support.

\$99/seat/mo

SAAS PREMIUM

Multi-tenant + ClaudeAdapter

Org isolation, RBAC, SSO, PDF export, advanced OSINT sources (Shodan/Censys/Hunter), priority support, usage metering.

\$499/seat/mo

ENTERPRISE

Air-gapped + custom adapters

Custom AI provider integration, custom OSINT data feeds, in-jurisdiction hosting, SOC2 attestation.

Annual contract

Go to market.

0 → 1K self-hosted users (Q3 2026)

Launch on Hacker News, OSINT Discords (TraceLabs, Bellingcat), /r/OSINT, and the Cybersecurity OSS Slack. Bounty for the first 5 published case studies.

1K → 10K self-hosted users (2027)

Docs site + integration recipes for SpiderFoot, MISP, OpenCTI. Sponsor TraceLabs CTFs. Conference talks: DEF CON OSINT village, Black Hat Arsenal, FIRST.

10K → first 100 paid seats (2027)

Open-source funnel → hosted Team tier. 4% conversion at \$99/seat = \$400 / month for every 1,000 self-hosters.

Enterprise design partners (2027-2028)

Target 3 jurisdictions: EU fraud-investigation firms, US-MSSP IR teams, IGO-affiliated open-source investigators. 5-figure ACV pilots, then 6-figure expansion.

Why this is hard to copy.

Schema is the moat.

Merging an OSINT model + a Git-style forensic model into one consistent schema with cryptographic audit is a year of design decisions. Copying it requires copying the decisions, not the code.

Open core is the moat.

Closed-source competitors can't safely re-implement a hash chain without third-party audits we already publish. We benefit from their inability to copy without conceding the audit story.

Adapter pattern compounds.

Every new AI provider added by the community is a new feature for every user. Six adapters today. The seventh will land before we ship the next slide.

Audit chain is the trust anchor.

Investigators talk to other investigators. The product that survives a single court challenge is the product the field standardises on. We're playing for that single moment.

What we've shipped.

- **19 view-level UI screens shipped**

Dashboard, Investigations, Cases, Evidence, Branch graph, Entity graph, Network graph, Pipeline runner, Audit, Integrity, Monitors, Verification, AI Lab, Reports, Reviews.

- **6 AI adapters live**

MockAdapter (deterministic), OllamaAdapter, GLMAdapter, ClaudeAdapter, OpenRouterAdapter, NVIDIAAdapter.

- **End-to-end live runs**

47s NVIDIA Llama-3.3-70B pipeline against INV-2025-020 → 11 findings, 5 entities, 7 relations.
82s OpenRouter gpt-oss-120b run on same target → 10 findings, 9 entities, 8 relations + bridge → case + 13 evidence promotions.

- **Audit chain proven**

verifyAuditChain() green at 19 entries after the full demo cycle. Method documented + reproducible offline.

- **Documentation pack**

BRD, SRS, SDS, DFD, Deployment plan, Architecture ADRs, Threat model, API reference, Runbook + this deck.

Team.

Ali Murtaza Bhutto — Founder + technical lead

AI Security Engineer + OSINT specialist.

- CEH V13, CHFI, CNSP, CAP V2, ISO 27001 Associate
- Basel OSINT, Picus Purple Team
- NVIDIA DLI RAG, DeepLearning.AI (LangChain, RAG, Red Team)
- Anthropic Prompt-Engineering + Agentic Workflows
- 3 published research papers on Zenodo (ORCID 0009-0007-2787-943X)
- GitHub: thunderstornX — 15+ shipped OSS security tools

Hiring next

Two engineers + one design partner.

1. Senior platform engineer — Postgres + RBAC + multi-tenant.
2. ML engineer — adapter integrations + tool-use + agent supervision.
3. Design partner — boutique OSINT firm or IR/forensics team with an active caseload and willingness to give weekly feedback.

The ask.

\$500K SAFE @ \$10M
post-cap.

Buys us 18 months of runway. Concrete deliverables:

Q3 2026 Docker-compose deploy + on-call runbook + first 50 self-hosted users.

Q4 2026 PDF report export · multi-tenant org isolation · ClaudeAdapter live.

Q1 2027 Third-party cryptographic audit of the chain. First court-admissible export.

Q2 2027 First 10 paying Team-tier customers. \$30K MRR.

Q3 2027 First 3 SaaS-premium pilots. \$100K ARR.

Risk-adjusted math

OSS funnel: 50K visitors → 10K installs → 400 paid seats

ARR at month 18: \$1.4M (blended \$300/seat)

Capital efficiency: \$500K → \$1.4M ARR = 2.8× revenue

Burn: 3 FTE × \$7K/mo + infra \$1K/mo = \$22K/mo

Runway: \$500K / \$22K = 22 months

Vision.

Every investigation, public and private, on one chain.

Forenix-oss starts as the analyst's daily driver. It ends as the default substrate for investigative work — wherever public-source intelligence meets evidentiary standards. Investigators talk to investigators. The product that survives a single court challenge is the product the field standardises on. We're building for exactly that moment, and we're building it in the open so the next generation of investigators starts with infrastructure instead of spreadsheets.

OSINT × Forensics, one workflow, one chain.
